

Down

1. Software used to perform workplace tasks.
2. Process of establishing a trusted connection between two nearby devices.
3. Features that determine a device's geographic position.
7. Policy allowing personally owned equipment to access workspace resources.
12. Equipment issued and controlled by an organization for work use.
16. Service used to send and receive electronic messages.
17. Feature that shares a cellular internet connection with nearby devices.
19. Built-in programmable chip used instead of removable carrier card.
21. Satellite-based system used to determine geographic position.
22. Stored collection of names, phone numbers, and other personal information.
24. Fourth-generation cellular standard providing high-speed mobile broadband.

Across

4. Keeping information consistent across multiple devices or services.
5. Third-generation cellular standard supporting basic mobile internet access.
6. Short-range radio technology used to connect nearby devices.
8. Work-related software distributed or controlled by an organization.
9. Radio-based technology used to connect devices to a local network.
10. Fifth-generation cellular standard offering higher speeds, lower latency, and greater capacity.
11. Positioning method that estimates location using nearby carrier towers.
13. Application used to store appointments, events, and schedules.
14. Short numeric code used to verify access or approve a connection.
15. Removable chip that authenticates a phone to a carrier account.
18. Applying required security and usage rules to manage equipment.
20. Remote service used to save and access files over the Internet.
23. Maximum amount of cellular usage allowed during a billing period.
25. Centralized system for controlling and securing organization-owned or enrolled devices.
