Across

4. Security framework that verifies identities, controls permissions, and records user activity.
6. Network resource that allows multiple users to access the same stored documents and folders.
13. Email security system that filters unwanted or malicious messages before delivery.
14. Industrial computer platform used to monitor and operate machinery and infrastructure.
15. Computer that sends, receives, and stores electronic messages for users.
16. Computer that delivers websites and other content to browsers using HTTP or HTTPS.
17. Computer or software that manages and queues jobs sent to shared output devices.
18. Specialized computer built into a larger device to perform specific tasks.

Down

1. Security appliance combining firewall, malware protection, and intrusion prevention functions.
2. Computer that stores, organizes, and retrieves structured information for applications.
3. Network service that automatically assigns IP addresses and related settings. Uses UDP ports 67-68.
5. Standard for collecting and transmitting event logs from computers and networking equipment.
7. Device or software that distributes incoming requests across multiple machines to improve performance and availability.
8. Communication standard that synchronizes device clocks. Uses UDP port 123.
9. Network service that translates hostnames into IP addresses. Uses port 53.
10. Physical object equipped with electronics that exchange information over a network.
11. Older computing technology still in use despite newer alternatives being available.
12. Intermediary that forwards requests between clients and other network resources.
